

# PENETRATION TESTING REPORT

## Mediroza General Hospital Black-Box Security Assessment

|                 |                                               |
|-----------------|-----------------------------------------------|
| Client          | Mediroza General Hospital                     |
| Target          | https://medirozahospital.com                  |
| Engagement Type | Black-Box Penetration Test                    |
| Duration        | 3 Days                                        |
| Date of Report  | September 7, 2026                             |
| Tester          | Pradheepa. M                                  |
| Classification  | CONFIDENTIAL                                  |
| Batch / Program | Networkwalks Internship — Batch B082   Week 4 |

*This engagement was conducted in a controlled environment for educational purposes only. All testing was performed under written authorization. Techniques demonstrated must never be applied to any system without explicit written permission from the owner.*

## 1. Executive Summary

A 3-day black-box penetration test was conducted against the external web infrastructure of Mediroza General Hospital. The objective was to identify vulnerabilities in the patient/staff portal and assess the exposure of sensitive internal data.

The test successfully compromised the target infrastructure, leading to unauthorized access to **30 employee payroll records**, **shareholder agreements**, and **3 confidential patient pathology reports**. The attack chain exploited a critical SQL Injection vulnerability to bypass authentication, followed by weak cryptographic controls on PDF files, and culminated in the discovery of a publicly accessible database backup.

**Overall Risk Posture: CRITICAL**

Mediroza General Hospital's external web presence is considered highly susceptible to data breach. Immediate remediation of the SQL Injection flaw and data exposure issues is required to protect patient and employee Personally Identifiable Information (PII).

## 2. Scope & Methodology

| Attribute        | Details                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------|
| Target Domain    | https://medirozahospital.com                                                                     |
| Testing Type     | Black-Box (No internal credentials or source code provided)                                      |
| Testing Duration | 3 Days                                                                                           |
| Tools Used       | Firefox DevTools, Burp Suite, Manual SQLi, gobuster, pdfcrack, exiftool, wget, grep, rockyou.txt |
| Authorization    | Written authorization granted by the client prior to testing                                     |

Methodology: reconnaissance → vulnerability identification → exploitation → post-exploitation analysis → documentation with full evidence.

## 3. Detailed Findings & Technical Exploitation

### Finding 1: SQL Injection Authentication Bypass (Critical)

**Severity: CRITICAL**

#### Vulnerability Synopsis

The /staff/login.php endpoint was vulnerable to Boolean-based SQL Injection. The username parameter failed to sanitize user input, allowing an attacker to inject SQL that always evaluates to true.

#### Attack Exploitation

Payload used:

```
Username: admin' --
Password: [ANY]
```

This payload comments out the password check, granting administrative access without valid credentials. Access was obtained to the Patient Document Management System containing 3 sensitive PDF lab reports.

### Finding 2: Weak Cryptographic Storage (PDF Encryption) (High)

**Severity: HIGH**

Patient reports were protected with Standard V2.3 (128-bit RC4) encryption using weak, dictionary-crackable passwords. pdfcrack + rockyou.txt recovered the passwords in seconds (examples: 123456, password, med123, admin2024).

Decrypted reports revealed confidential pathology data for patients Sipho Dlamini, Priya Reddy and Emily Thompson.

### Finding 3: Sensitive Data Exposure — Directory Listing & DB Dump (Critical)

**Severity: CRITICAL**

The legacy directory /old/ had directory listing enabled and exposed mediroza\_db\_backup\_2019.sql. The dump contained the full staff table (~30 employee records with salaries in ZAR) and the shareholders table (ownership stakes and share classes).

Key Exposed Salary Data (sample)

| Employee                | Title                   | Monthly (ZAR) |
|-------------------------|-------------------------|---------------|
| Dr. Johan van der Merwe | Medical Director        | R 160,000     |
| Sarah Botha             | Chief Financial Officer | R 152,000     |
| Dr. Rajesh Naidoo       | Chief Pathologist       | R 138,000     |
| Dr. Vikram Chetty       | Anaesthetist            | R 135,000     |
| Linda Fourie            | Receptionist            | R 19,000      |

| Shareholder             | Ownership % | Class        |
|-------------------------|-------------|--------------|
| Dr. Rajesh Naidoo       | 18.0%       | Ordinary     |
| Cedar Health Holdings   | 15.0%       | Ordinary     |
| Dr. Johan van der Merwe | 12.0%       | Ordinary     |
| Dr. Vikram Chetty       | 4.0%        | Preferential |

## 4. Risk Assessment Matrix

| Vulnerability           | Impact                   | Likelihood      | Severity |
|-------------------------|--------------------------|-----------------|----------|
| SQL Injection           | Full unauthorized access | High (trivial)  | CRITICAL |
| Data Exposure (DB Dump) | Financial & PII leak     | High (public)   | CRITICAL |
| Weak PDF Encryption     | Medical record exposure  | High (wordlist) | HIGH     |

## 5. Remediation Strategy & Recommendations

### 1. Immediate Fix for SQL Injection

- Replace dynamic query concatenation with Parameterized Queries (PDO / MySQLi Prepared Statements).
- Timeline: Immediate (24 hours).

### 2. Secure Database Backups

- Move the SQL backup outside the web root. Disable directory listing (Options -Indexes).
- Timeline: Immediate (24 hours).

### 3. Enforce Strong PDF Password Policy

- Use randomly generated 16+ character passwords (alphanumeric + symbols) for patient PDFs.
- Timeline: 1 Week.

### 4. Audit Legacy Files

- Full scan of the web server for remaining .sql, .log, .bak or other sensitive files.
- Timeline: 1 Week.

## 6. Conclusion

The assessment of <https://medirozahospital.com> revealed a critical attack path from an exposed login interface to the exfiltration of sensitive financial and medical data. Weak controls (SQL injection) and poor storage practices (world-readable backup) create significant breach risk. Immediate remediation is recommended to mitigate legal exposure under POPIA.

**Prepared by:** Pradheepa. M  
**Program:** Networkwalks Internship — Batch B082 | Week 4  
**Date:** September 7, 2026

## Appendix A: Complete Evidence Package (All 24 Screenshots)

The following pages contain every screenshot captured during the engagement, numbered 1–24. They document the full attack chain from initial setup through final data extraction.
